(a) Table $T_0 = \mathrm{Ins}(a_1, \ldots, a_4)$, before the push

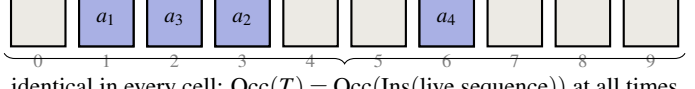

(b) After push of x (home 2; cells 2, 3 occupied; stored in cell 4): only cell 4 is written

Insertion depends only on which cells are occupied and changes only one cell, so removing the *newest* key restores the previous table bit for bit.

(c) After pop of x: cell 4 is cleared, and the table is T_0 again

identical in every cell: $\mathrm{Occ}(T) = \mathrm{Occ}(\mathrm{Ins}(\text{live sequence}))$ at all times
